### Task 1.5 Calculating $\lambda$ .

|     |                                                                                                                                                                                                                             |     |
|-----|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 1.5 | <p>From any slope and the value of <math>L_0</math> one finds,</p> $\lambda = \frac{L_b - L_a}{2L_a L_b} \frac{m_R^2 m_L^2}{m_R^2 + m_L^2}$ <p>Using the suggestion to replace <math>d = L_b - L_a</math>, we can write</p> | 2.0 |
|-----|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|

$$\lambda = \frac{d}{2L_a L_b} \frac{m_R^2 m_L^2}{m_R^2 + m_L^2}$$

$$\lambda \pm \Delta\lambda = (663 \pm 25) \times 10^{-9} \text{ m}$$

The uncertainty may range from 15 to 30 nanometers.

A precise measurement of the wavelength is  $\lambda \pm \Delta\lambda = (655 \pm 1) \times 10^{-9} \text{ m}$ .

The formula for the uncertainty,

$$\Delta\lambda = \sqrt{\left(\frac{\partial\lambda}{\partial d}\right)^2 \Delta d^2 + \left(\frac{\partial\lambda}{\partial L_a}\right)^2 \Delta L_a^2 + \left(\frac{\partial\lambda}{\partial L_b}\right)^2 \Delta L_b^2 + \left(\frac{\partial\lambda}{\partial m_R}\right)^2 \Delta m_R^2 + \left(\frac{\partial\lambda}{\partial m_L}\right)^2 \Delta m_L^2}$$

one finds,

$$\frac{\partial\lambda}{\partial d} = \frac{\lambda}{d}, \quad \frac{\partial\lambda}{\partial L_b} = \frac{\lambda}{L_b}, \quad \frac{\partial\lambda}{\partial L_a} = \frac{\lambda}{L_a} \quad \text{and} \quad \frac{\partial\lambda}{\partial m_R} = \frac{2m_L^2}{m_R} \frac{\lambda}{m_L^2 + m_R^2}$$

and analogously for the other slope.

One can calculate directly these quantities. However, one may note that the errors due to  $L_a$ ,  $L_b$  and  $d$  are negligible. Moreover,  $m_R^2 \approx m_L^2$  and  $L_a \approx L_b$ . This implies,

$$\frac{\partial\lambda}{\partial m_R} \approx \frac{\lambda}{m_R} \approx \frac{\partial\lambda}{\partial m_L}. \text{ Thus,}$$

$$\Delta\lambda \approx \sqrt{2} \frac{\lambda}{m_L} \Delta m_L \approx (25 \times 10^{-9}) \text{ m}$$

Answer Form  
Experimental Problem No. 2  
Birefringence of mica

Task 2.1 a) Experimental setup for  $I_p$ . (0.5 points)

Task 2.1 b) Experimental setup for  $I_o$ . (0.5 points)

|-----|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|
| 2.6 | <p>We now perform a least square analysis for the variables <math>y</math> vs <math>x</math> in Table II. The slope and <math>y</math>-intercept are:</p> $m \pm \Delta m = 0.913 \pm 0.012$ $b \pm \Delta b = -0.010 \pm 0.008$ <p>The formulas for this analysis are:</p> | 1.75 |
|-----|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|

$$m = \frac{N \sum_{n=1}^N x_n y_n - \sum_{n=1}^N x_n \sum_{n'=1}^N y_{n'}}{\Delta}$$

$$b = \frac{\sum_{n=1}^N x_n^2 \sum_{n'=1}^N y_{n'} - \sum_{n=1}^N x_n \sum_{n'=1}^N x_{n'} y_{n'}}{\Delta}$$

where

$$\Delta = N \sum_{n=1}^N x_n^2 - \left( \sum_{n=1}^N x_n \right)^2$$

with  $N$  the number of data points.

The uncertainty is calculated as

$$(\Delta m)^2 = N \frac{\sigma^2}{\Delta} \quad , \quad (\Delta b)^2 = \frac{\sigma^2}{\Delta} \sum_{n=1}^N x_n^2 \quad \text{with,}$$

$$\sigma^2 = \frac{1}{N-2} \sum_{n=1}^N (y_n - b - m x_n)^2$$

with  $N = 12$  in this example.

Since the data may appear somewhat disperse and/or the errors in the intensities may be large, a graphical analysis may be performed.

In the accompanying plot, it is exemplified a simple graphical analysis: first the main slope is found, then, using the largest deviations one can find two extreme slopes.

The final result is,

$$m = 0.91 \pm 0.08 \quad \text{and} \quad b = -0.01 \pm 0.04$$

The calculation of the birefringence and its uncertainty follows as before. One now finds,

$$|n_1 - n_2| \pm \Delta|n_1 - n_2| = (3.94 \pm 0.45) \times 10^{-3}.$$

A larger (more realistic) error.
